Bits 22:0 **SWIERx:** Software Interrupt on line x

If interrupt are enabled on line x in the EXTI_IMR register, writing '1' to SWIERx bit when it is set at '0' sets the corresponding pending bit in the EXTI_PR register, thus resulting in an interrupt request generation.

This bit is cleared by clearing the corresponding bit in EXTI_PR (by writing a 1 to the bit).

ARM Cortex M4

1.ISER (Interrupt Set-Enable Registers)
- •Used to enable specific interrupts
- •Has 8 32-bit registers, but STM32F401RC uses fewer since it has 85 interrupt lines
- •Writing 1 enables the corresponding interrupt, writing 0 has no effect

2.ICER (Interrupt Clear-Enable Registers)
- •Used to disable specific interrupts
- •Writing 1 disables the corresponding interrupt, writing 0 has no effect

3.ISPR (Interrupt Set-Pending Registers)
- •Used to force interrupts into a pending state
- •Useful for testing interrupt service routines

4.ICPR (Interrupt Clear-Pending Registers)
- •Used to clear pending status of interrupts

5.IABR (Interrupt Active Bit Registers)
- •Read-only registers that show which interrupts are currently active

6.IPR (Interrupt Priority Registers)
- •Sets priority levels for each interrupt
- •Each interrupt has 4 bits of priority (16 levels)
- •Lower number means higher priority
